

1. Background

Parkinson's disease is the second most neurodegerative disorders, common affecting more than 10 million people worldwide. Objective and continuous monitoring of motor performance in daily living is of fundamental importance.

2. Objectives

Develop cheap, non-invasive, wearable, effective solutions for large-scale longterm monitoring of movement disorders in real-life scenarios.

3. Methods

5. Conclusions

The combination of wearable sensors and machine learning allows objective motion analysis. Results suggest that non-invasive wearable solutions can detect and analyze different activities of daily living, providing information regarding gait impairment, postural stability, and disease progression.
